

Application Program Development

Segment : Thread Synchronization

Presenter Name

Outcomes

- Understanding of Thread Synchronization.
 - Understanding of Race Condition.
 - Understanding of Why Synchronization needed.
 - Implementation of Thread Synchronization.
 - Block Synchronization.
 - Method Synchronization.
 - Understanding of DeadLock.
- 

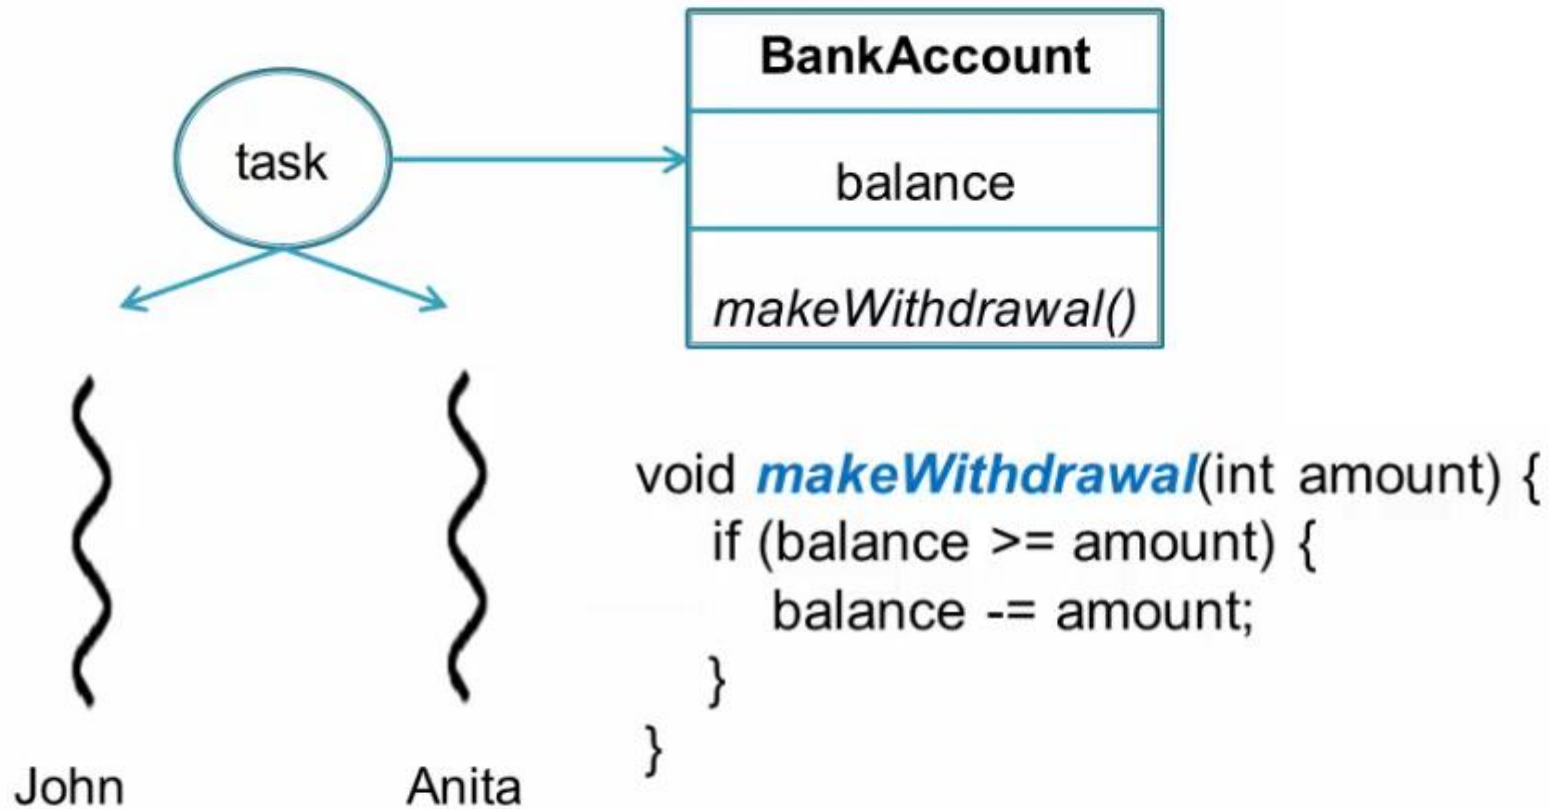

Thread Synchronization

- A shared resource may be corrupted if it is accessed simultaneously by multiple threads. For example, two unsynchronized threads accessing the same bank account may cause conflict.

Concurrency Hazard: Race Condition

Concurrency Hazard: Race Condition

John and Anita wants to withdraw \$75

John

Enters *makeWithdrawal()*
checks *balance* \geq *amount*
Moved to RUNNABLE

Anita

Enters *makeWithdrawal()*
checks *balance* \geq *amount*
balance -= amount
Balance -> 25

Moved to Running
Overdraws assume the
balance is 100

BankAccount object was not ***thread safe***

└─→ *mutable state* → *shared* → *not properly managed*

Race Condition ~ *check-then-act*

```
void makeWithdrawal(int amount) {  
    if (balance >= amount) {  
        balance -= amount;  
    }  
}
```

} ***atomic unit***

Synchronization Concept

- Synchronization is built around the concept known as the *intrinsic lock*
- Every object has an intrinsic lock associated with it
- A thread that needs access to an object's fields has to *acquire* the object's intrinsic lock
- A thread has to *release* the intrinsic lock when it's done with an object
- A thread is said to *own the intrinsic lock* since acquires until releases the object's intrinsic lock
- Any *other thread will block* when it attempts to acquire the object's intrinsic lock, if the lock is owned by another thread

Why Synchronization?

- The synchronization is mainly used to
 - Prevent thread interference.
 - Prevent consistency problem.

Types of Synchronization

- There are two types of synchronization
 - Process Synchronization.
 - Thread Synchronization.

Thread Synchronization

- There are two types of thread synchronization mutual exclusive and inter-thread communication.

1. Mutual Exclusive

- Synchronized method.
- Synchronized block.
- static synchronization.

2. Cooperation (Inter-thread communication in java)

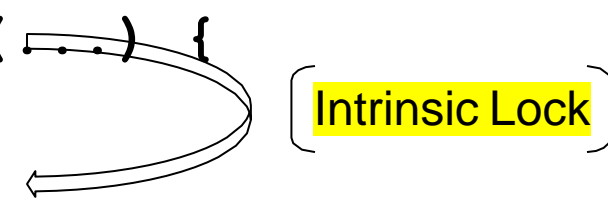

Mutual Exclusive

- Mutual Exclusive helps keep threads from interfering with one another while sharing data. This can be done by three ways in java:
 - by synchronized method
 - by synchronized block
 - by static synchronization

Synchronized Method

- When a thread invokes a synchronized method, it automatically acquires the intrinsic lock for that method's object
- In a synchronized method, the thread releases the acquired lock when the method returns

```
class X implements Runnable {  
    ...  
    synchronized void method(...) {  
        ...  
        return;  
    }  
    public static void main(...) {  
        Thread t = new Thread(new X());  
        t.start();  
    }  
}
```

The diagram illustrates the lock mechanism. A curved arrow points from the opening curly brace of the `synchronized void method(...)` block to a yellow box labeled "Intrinsic Lock". A second curved arrow points from the closing curly brace of the same block back to the "Intrinsic Lock" box, indicating that the lock is released upon method completion.

```
Class Table{
    void printTable(int n){//method not synchroniz
ed
    for(int i = 1; i <= 5; i++){
        System.out.println( n * i);
        try{ Thread.sleep(400);

    }catch(Exception e){System.out.println(e);}
    }
}
class MyThread1 implements Runnable{
    Table t;
    MyThread1(Table t){
        this.t=t; }
    @Override
    public void run(){
        t.printTable(5);
    }
}
```

```
class MyThread2 implements Runnable{
```

```
    Table t;
```

```
    MyThread2(Table t){
```

```
        this.t=t;
```

```
    }
```

```
    @Override
```

```
    public void run() {
```

```
        t.printTable(100);
```

```
    }
```

```
}
```

```
class TestSynchronization1{
```

```
    public static void main(String args[]){
```

```
        Table obj = new Table();
```

```
        Thread t1 = new Thread(new MyThread1(obj));
```

```
        Thread t2 = new Thread(new MyThread2(obj));
```

```
        t1.start();
```

```
        t2.start();
```

```
    }
```

```
}
```

Output:

5

100

10

200

15

300

20

400

25

500

Inconsistent

```
Class Table{
    synchronized void printTable(int n) {
        //method synchronized
        for(int i = 1; i <= 5; i++) {
            System.out.println( n * i);
            try{ Thread.sleep(400);

        }catch (Exception e) {System.out.println(e); }
        }
    }
}
class MyThread1 implements Runnable{
    Table t;
    MyThread1(Table t) {
        this.t=t; }
    @Override
    public void run() {
        t.printTable(5);
    }
}
```

```
class MyThread2 implements Runnable{
```

```
    Table t;
```

```
    MyThread2(Table t){
```

```
        this.t=t;
```

```
    }
```

```
    @Override
```

```
    public void run() {
```

```
        t.printTable(100);
```

```
    }
```

```
}
```

```
class TestSynchronization1{
```

```
    public static void main(String args[]){
```

```
        Table obj = new Table();
```

```
        Thread t1 = new Thread(new MyThread1(obj));
```

```
        Thread t2 = new Thread(new MyThread2(obj));
```

```
        t1.start();
```

```
        t2.start();
```

```
    }
```

```
}
```

Output:

5

10

15

20

25

100

200

300

400

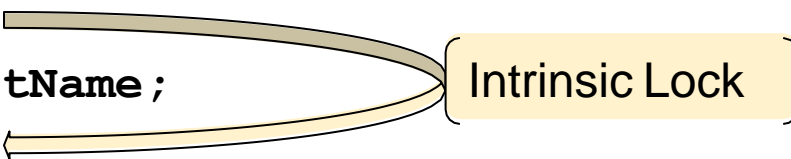

500

Consistent

Synchronized Block

- Synchronized statements must specify the object that provides the intrinsic lock
- In a synchronized statements , the thread releases the acquired lock when the last statement is executed
- Synchronized block is used to lock an object for any shared resource.
- Scope of synchronized block is smaller than the method.

```
public void addName(String studentName) {  
    synchronized(this) {  
        lastName = studentName;  
        nameCount++;  
    }  
    studentList.add(studentName);  
}
```

The diagram illustrates the execution of a synchronized block. A yellow box labeled "Intrinsic Lock" is connected by two curved arrows to the "synchronized(this)" block in the code. One arrow points from the lock box to the opening curly brace of the synchronized block, and the other points from the closing curly brace back to the lock box, indicating that the lock is acquired at the start and released at the end of the block's execution.

Static Synchronization

- If you make any static method as synchronized, the lock will be on the class not on object.
- Suppose there are two objects of a shared class(e.g. Table) named object1 and object2.
- In case of synchronized method and synchronized block there cannot be interference between t1 and t2 or t3 and t4 because t1 and t2 both refers to a common object that have a single lock.
- But there can be interference between t1 and t3
- or t2 and t4 because t1 acquires another lock and t3 acquires another lock.
- I want no interference between t1 and t3 or t2 and t4.
- Static synchronization solves this problem.

Deadlock Example

- The threads **t1** and **t2** are blocked forever, waiting for each other - this problem is defined as being a *deadlock*

```
public class TestDeadlockExample1 {
    public static void main(String[] args) {
        final String resource1 = "Some Name";
        final String resource2 = "Other Name";

        // t1 tries to lock resource1 then resource2
        Thread t1 = new Thread() {
            public void run() {
                synchronized (resource1) {
                    System.out.println("Thread 1: locked resource 1");

                    try { Thread.sleep(100);} catch (Exception e) {}

                    synchronized (resource2) {
                        System.out.println("Thread 1: locked resource 2");

                    }
                }
            }
        };
    }
};
```

```
// t2 tries to lock resource2 then resource1

Thread t2 = new Thread() {
    public void run() {
        synchronized (resource2) {
            System.out.println("Thread 2: locked resource 2");

            try { Thread.sleep(100);} catch (Exception e) {}

            synchronized (resource1) {
                System.out.println("Thread 2:locked resource 1");
            }
        }
    }
};
t1.start();
t2.start();
}
```

Output: Thread 1: locked resource 1
Thread 2: locked resource 2
